NORRLANDA ORGAN -

The world's oldest surviving organ fragments, dating c1370-1400. Built by an unknown builder for a church in *N*, on the island of <u>Gotland</u>, the *NO* case remains intact with its original keyboard, <u>pedals</u> (one of the earliest known, cf. <u>Halberstadt 1361</u>), action, and windchests. These remnants are now on display in the National Historical Museum in Stockholm. The lowest pipe of the *NO* seems to have been about 3' long, and the lowest 8 pipes in the side flats were playable only by the 8 pedals using a tracker system where each pedal key simultaneously played two notes, a fourth or fifth apart. The organ has a fully chromatic manual compass of 22 keys, beginning where the pedal leaves off, for a complete compass of C D E F G A B b B \starteq ca¹. The keys for diatonic notes, including B^b, are on one level, with keys for C[#], D[#], F[#], and G[#] arranged in pairs on a higher level. Mads Kjersgaard has done extensive research on the *NO* and a fully playable replica has been built at Ostheim (D:) - see <u>www.orgelbaumuseum.de/ausstellung/die-geschichte-der-orgel/</u>.
